B.ED.101-CHILDHOOD AND GROEING UP
Practical:Adolescent Holistic Development Plan

Academic Year 2025-26

Name of the Student: Rohini Ramesh Patil **Roll No. :** 04

EVALUATION SCHEME

Rating Scale 1)Unsatisfactory 2)Average 3)Satisfactory 4)Good 5)Excellent

Sr.No.	Criteria	1	2	3	4	5
1	Introduction (प्रस्तावना)				/	
2	Understanding of adolescent characteristics and developmental needs (कुमारवयीन विद्यार्थ्यांच्या वैशिष्ट्ये व विकासात्मक गरजांचे आकलन)				/	
3	Clarity and relevance of objectives in the plan (आराखड्यातील उद्दिष्टांची स्पष्टता व सुसंगती)					/
4	Inclusion of all five dimensions- physical,emotional,cognitive,social and moral (सर्व पाच पैलूंचा - शारीरिक, भावनिक, बौद्धिक, सामाजिक, नैतिक -समावेश)				/	
5	Relevance and practicality of suggested classroom activities (सुचवलेल्या वर्गातील क्रियाकलापांची उपयुक्तता व व्यवहार्यता)					/
6	Creativity and innovation in planning activities (क्रियाकलापांचे नियोजन करताना सर्जनशीलता व नाविन्य)				/	
7	Presentation,organization,and visual appeal of the plan (आराखड्याचे सादरीकरण, मांडणी आणि दृश्य आकर्षकता)					/
8	Reflection and insight on holistic development (सर्वांगीण विकासावरील चिंतन व अंतर्दृष्टी)					/
9	Educational implications (शैक्षणिक उपयोजन)				/	
10	Overall impact (एकूण प्रभाव)				/	
Total mark-50		44

Signature of Professor In-charge

• Introduction -

A classroom is a miniature representation of society where learners come with different backgrounds, abilities, interests, learning speeds, and learning styles. Some students understand concepts quickly, while others need more time and support. Some students prefer visual learning, some learn better by listening and others learn effectively by doing activities. Therefore, it becomes the responsibility of the teacher to understand learner diversity and plan teaching-learning activities accordingly.

Science as a subject requires not only theoretical understanding but also observation, experimentation and logical reasoning. The chapter "Force and Laws of Motion" in std 8 science is a fundamental chapter that helps students understand how objects move, why objects remain at rest, and how force affects motion in daily life. Concepts such as push, pull, speed, direction, inertia and interaction between objects are closely related to students everyday experiences.

When this topic is taught only through textbook reading, students may memorize laws without understanding them.

• Objectives of the Practical.

The objectives of this practical are as follows:

- To develop understanding of force
- Students should be able to explain force as a push or pull and identify examples of force from daily life.
- To understand the laws of motion
- Students should understand Newton's three laws of motion and their importance in explaining motion.
- To recognize learner diversity.
- The teacher should identify different learning styles, abilities and interests present in the classroom.
- To design learner-centered activities.
- Activities should be planned according to the needs of visual, auditory and kinesthetic learners.
- To encourage active participation.
- Students should actively participate in discussions, experiments and group work
- To promote scientific thinking
- Students should develop observation, reasoning and analytical skills.
- To ensure inclusive education.
- Learning opportunities should be provided to every students regardless of ability speed.

• Selected Subject and Topic

• Meaning of force -

Force is defined as a push or pull that can change the state of rest, motion, direction or shape of an object. In our daily life, we use force in many activities such as opening a door, lifting a bag, kicking a ball, stopping a moving vehicle. Force can be applied by muscles, machines, gravity, friction or magnetism.

• Effects of force -

Force can produce several effects on an object. : Change in speed :

A force can increase or decrease the speed of an object.

change in direction :

A moving object can change its direction due to force.

change in shape :

Force can stretch, compress or deform objects.

start or stop motion :

Force can make a stationary object move or stop a moving object.

• Balanced and Unbalanced Forces -

Balanced Forces :

When equal forces act on an object in opposite directions, they cancel each other. There is no change in motion.

• Observation and Reflection :-

- Students were highly motivated.
- Better understanding through activities
- Improved co-operation
- Increased confidence among slow learners.
- positive learning environment observed.
- Positive attitude towards learning
- Better understanding of scientific laws
- Improved Confidence in expressing ideas
- Enhanced teamwork and co-operation
- Increased ~~curiosity~~ curiosity towards science
- Students developed better understanding of force and motion. They also improved their observation, reasoning and communication skills.

The lesson on "**Force and Laws of Motion**" became meaningful and enjoyable for students.

◦ Overall Conclusion

Teaching the chapter force and Laws of motion using diverse learning strategies proved effective. learner diversity was addressed successfully. Activity - based and inclusive teaching enhanced understanding and participation. Such teaching methods should be encouraged.

The practical on the topic "Force and Laws of Motion" proved to be a valuable learning experience in understanding both scientific concepts and the importance of learner diversity in the classroom. This practical clearly demonstrated that effective teaching is not limited to the delivery of content but involves careful planning, selection of appropriate teaching strategies and continuous reflection on the teaching - learning process.

• Opinion

This practical helped me understand the importance of learner diversity. Teaching science through activities made learning interesting. The topic became easy to understand through experiments. All students were actively involved. Visual aids improved understanding. Hands-on learning increased curiosity. Discussion clarified doubts. Inclusive teaching helped every learner. Such methods promote scientific thinking. This practical enhanced my teaching skills. It was a meaningful learning experience.

- Q.1.
1. ~~c) Both heredity and environment play complementary roles in development.~~
 2. ~~b) Growth is measurable whereas development shows qualitative changes.~~
 3. ~~c) Empathetic and guiding role~~
 4. ~~c) Physical, mental, emotional, social and moral development~~
 5. ~~b) Students differ physically, intellectually and socially~~
 6. ~~c) Personality~~
 7. ~~c) Teaching can be made more effective~~
 8. ~~a) Intelligence is single~~
 9. ~~c) Identity vs. Role confusion~~
 10. ~~c) To provide equal opportunity and respect~~

to all students

Q.2

i) → Growth and development are natural processes which start from birth and continue throughout life. Growth means physical increase in height and weight, while development means overall changes in behaviour, ability and personality. The following are the main principles of growth and development:

1) Principle of continuity:-

Growth and development are continuous processes. They do not stop at any stage of life. For example, a person continues to learn and become emotionally mature even in adulthood.

2) Principle of Individual Differences:-

Every child is different, children grow and develop at their own speed. For example, some children learn to speak early, while others learn later.

3) Principle of Direction:-

Development follows a proper direction. It starts from head to toe and from the centre of the body to outer parts. For example, a child controls head movement before learning to walk.

4) Principle of Uniform Pattern:-

All children follow the same pattern of development, but the speed may differ. For example, children first

crawl, then stand and then walk.

5) Principle of Interrelation:-

Different aspects of development are connected with each other. Physical health affects mental and emotional development. For example, a weak child may find it difficult to concentrate on studies.

6) Principles of Heredity and Environment:-

Both heredity and environment affect growth and development. Heredity gives abilities, while environment helps to develop them. For example, a child with good ability needs a good learning environment.

7) Principle of predictability:-

Development can be predicted to some extent. Teachers can expect certain behaviours at certain ages, like curiosity in childhood.

Thus, knowledge of these principles helps teachers to understand students better and plan effective teaching.

Dhakeshwar Shikshanshasthra Mahavidyalaya,
Dhayari, Pune-41

B.Ed. First year 2025-26

Activity 1: Tutorial

Sub: B.Ed. 101 Childhood And Growing Up

Name of Student - Rohini Ramesh Patil

Roll No - 04

Date -

Q.1. Explain the concept of Heredity and Environment and social heredity with suitable examples. As a teacher, how would you use these concepts in the teaching-learning process?

→ Heredity - "Heredity is the transmission of characteristics through the genes from the ancestors to the off-spring."

Heredity Process - At the time of conception 23 Chromosomes from father and 23 chromosomes - from mother are transmitted through the offspring's. If the offspring gets xx - chromosomes pair that will be female and if it is xy then it will be male.

Nature of Heredity

Physical Heredity

i) Physical Heredity - it includes the entire physique of an individual i.e. colour of skin and eyes, size, muscles etc.

Psychological Heredity

ii) Psychological Heredity - An intelligence, mental traits and instincts are mostly inherited. It has been found that the tendency to commit crime is also inherited in some cases.

• Environment -

The word environment has been explained as 'surrounding objects'. It implies that the word means all that surrounds the child from the time of his/her birth onwards till his/her death.

- Nature of Environment -

Life and environment are in fact correlative. man is a slave to environment. The child may have all kinds of capacity but they cannot fully develop without a proper environment. The environment starts influencing the child from the

embryonic stage.

there are three types of environment:

Types of environment

Natural Environment

Social Environment

Cultural Environment

• Influence of Environment on children -

following observations have been made about influences of the environment on children.

i) The child behaves as he is educated and the individual differences result from the education.

ii) Good education develops good character and intelligence.

iii) The environment of education at school shapes the child's personality in a particular way.

iv) Two people are kept in two different circumstances, they develop their capacities differently.

• Social Heredity

Social heredity refers to the transmission of social values, customs, beliefs, knowledge, attitudes and behavioural patterns from one generation to another through social learning and interaction, rather than through biological inheritance.

Social heredity includes learning through copying, imitation, teaching and
